The midterms were not any different from what I did in the prelims, just that I had to work as hard, if not harder, to get a better grade. I got a decent grade during the prelims with a 1.9 rating. I strived to get a higher mark, or at least maintain the high average. I sought to recite more during online classes, even if I occasionally answered wrong. I started to incorporate syntax in my notes to make sure I can recall them without needing to look at said notes. I practiced programming over and over like I did last term, all without the help of any generative AI programs. During this time, I got to make friends with people in 201I. I was able to help them understand the lessons given by explaining it to them, which in turn also helped me understand them at a deeper level. I assisted them in their Codechum programs, not spoonfeeding them, but giving them hints on where they went wrong, and I let them figure it out on their own.

This time, I was more in control of my situation with my classes rather than scrambling to catch up to the lessons. I was advanced reading, making sure I had somewhat of a grasp on the next lesson before my professor taught it so I will not be confused at the time of discussion. This term helped me to improve my skills in OOP and in problem solving by using logic.
